
Grade 3 Mathematics — Measurement: Capacity

Measuring capacity in litres

Learning Area Mathematics | Grade 3 | Time 30 min | Strand Measurement | Sub-Strand Capacity

30-Second Summary

🎯 **What learners will do by end:** Learners will measure capacity in litres using containers found at home and school, and appreciate why measuring capacity matters in everyday life.

⏱️ **Total time / prep time:** 30 minutes / prep estimate ≤20% of lesson time.

⭐ **The one thing that must not be skipped:** Every learner personally pours and measures at least one container's capacity using a 1-litre container, not just watches.

Lesson Details

SCHOOL ____________	DATE ____________	ROLL **B __ G __ Total __**
TEACHER'S NAME ____________	T.S.C NO. ____________	GENDER ____________

Lesson Learning Outcomes

By the end of the lesson, the learner should be able to:

a) **identify the litre as the unit used to measure capacity.**

b) **measure capacity in litres using a 1-litre container.**

c) **appreciate measuring the capacity of containers in litres.**

Key Inquiry Question(s)

How can the capacity of a container be measured?

Learning Resources

- Concrete objects/counters: various containers (buckets, bottles, jerry cans, cups)
- Water or sand for measuring
- A 1-litre container (bottle or improvised)
- Chalkboard and chalk

Introduction

~ 2 min

- Teacher opens with a real-life example: "Think about your mother buying milk from a milk vendor at home, or filling a jerry can with water from the tap. How does the vendor or your family know exactly how much milk or water they are getting?" (Learners respond with their own experiences.)
- Assumes ≥70% mastery of comparing objects as "more than / less than / same as" from the Mass sub-strand — quick 30-second recall check: "Which of these two bottles do you think holds more water, and how can you tell just by looking?" (Learners point and respond.)

Lesson Development

~ 20 min

1. **Teacher models measuring capacity**
   Fills a 1-litre bottle with water, pours it into a bucket, and thinks aloud: "That's 1 litre. I'll pour again and count." Ask: "How many litres do you think this bucket will hold in total?" Ask: "What happens to the water level each time I add one more litre?"

2. **Guided practice**
   Teacher and class work together with a jug and several 1-litre bottles. Ask: "If I have poured 3 litres so far, how many more until we reach 5 litres?" Learners take turns pouring while the class counts together (builds Communication and Collaboration).

3. **Independent task with a self-check**
   Learners work in pairs with improvised containers (cans, sufurias) and water. Ask: "Which container do you predict holds more, and why?" Each pair estimates the capacity of their container, then measures it using the 1-litre container and records their finding.
   Below-target learners: pair with a full-target learner for one-on-one support, re-doing the last worked example together.
   Full-target learners: compose a 2-line word problem about capacity for a partner to solve.

Illustration

Learners measure capacity with a 1-litre container

A 1-litre bottle fills a bucket

Conclusion

~ 4 min

- **Self-prediction check:** Show thumbs — green if you could teach this to a friend, yellow if you need one more example, red if you're still stuck.
- **Oral questions to summarise the lesson:** What unit do we use to measure capacity? If a bucket holds 5 litres and I pour out 2 litres, how much is left?

Extended Activities

~ 3 min

- **Full-target learners:** at home, find three different containers and estimate their capacity in litres, then measure them with a 1-litre bottle and record the results.
- **Below-target learners:** draw three containers they have at home and guess whether each holds more or less than 1 litre.

Reflection on the Lesson / Self-Remarks

___% of learners were able to measure capacity in litres accurately.

- **If learners underperform: re-do yesterday's counting warm-up with pebbles before starting today's Steps.**
- **If learners exceed expectation early: ask each pair to teach the concept to another pair in their own words.**
- **This plan is a recommendation — adapt based on real-time class response.**

Assessment Rubric

- ★ **Exceeding:** Measures accurately for all containers, explains process clearly.
- ✓ **Meeting:** Measures accurately for most containers.
- ▲ **Approaching:** Measures with some accuracy, needs prompting.
- ✕ **Below:** Needs significant support to measure or estimate.
